

# Design Patterns - TP3

## TP3 initial code

This is a template for the students' assignments.

Course material: ☑☑☑ <http://bit.ly/jmb-cpoa>

## Assignment info

**LAST NAME**

BRUEL

**First Name**

Jean-Michel

**Group #**

☒ Teachers

☐ 1

☐ 2

☐ 3

☐ 4

☐ Innopolis

## Requirements

You'll need:

☒ A [GitHub](#) account

☐ A [Git Bash](#) terminal (if you use Window\$)

Try the following command in your terminal to check your **git** environment:

```
git config --global -l
```

## Initial tasks

☒ Click on the Github Classroom link provided by your teacher (in fact, this should be done if you read this).

☐ Clone on your machine the Github project generated by Github Classroom.

- ❑ Modify the README file to add your last name, first name and group number.
- ❑ Commit and push using the following message:

 `commit/push`

```
fix #0 Initial task done
```

In the following, every time you'll see à `fix #...` text, make sure all your files are committed, and then push your modifications in the distant repo, making sure you used the corresponding message (`fix #...`) in one of the `commit` messages.

- If you want to check that you're really ready for `fix #0`, you can run the command in your shell: `make check`.
- If you want to list the Todos of the day, run `make todos`.

This TD exercise is inspired from the excellent [book](#): "Head First: Design Pattern. Bert Bates, Eric Freeman, Elisabeth Freeman, Kathy Sierra. Editions O'Reilly. 2005."

## The *Factory* pattern

### QUESTION

- Fully implement the Pizzeria application so that:
  - it implements the Abstract Factory
  - it implements the Singleton (for the factory)
  - the test program below will produce the result below

Start by writing this program and use *QuickFix* to "generate" the code as much as possible.

# Rendus attendus

## ToDo

- a `pom.xml` that runs the tests of your application
- a `build.gradle` that runs the tests of your application
- the class diagram of your application, in a file named `TP3.plantuml`, placed in a `docs` folder in your repo.

We will use the following pizzas model:

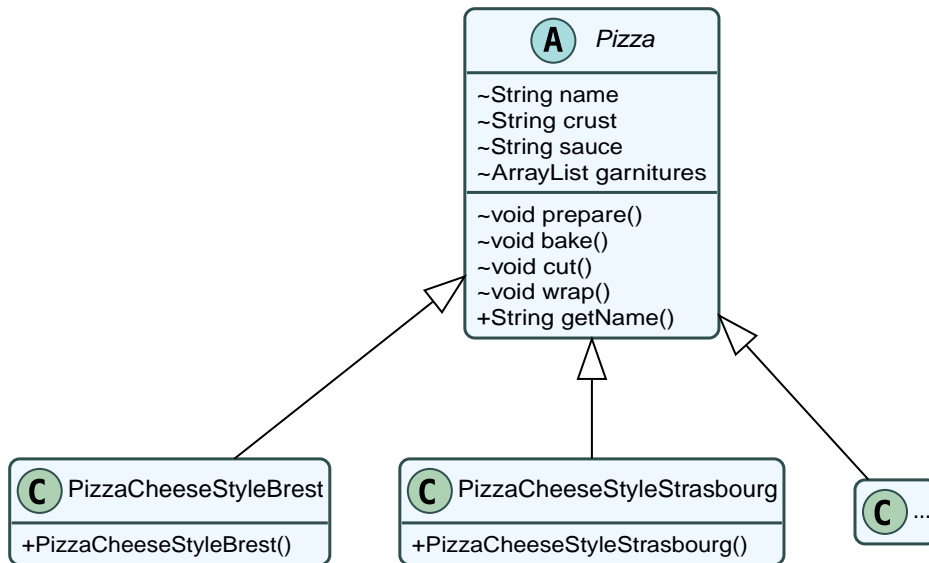

Diagram generated using <http://plantuml.sourceforge.net>.

Figure 1. Class diagram of the Pizzas

## Testing program

```
public class PizzaTestDrive {
    public static void main(String[] args) {
        Pizzeria shopFromBrest = PizzeriaFactory.getInstance().create("Brest");
        Pizzeria shopFromStrasbourg = PizzeriaFactory.getInstance().create
("Strasbourg");

        Pizza pizza = shopFromBrest.orderPizza("cheese");
        System.out.println("JMB has ordered a " + pizza.getName() + "\n");

        pizza = shopFromStrasbourg.orderPizza("cheese");
        System.out.println("JMI has ordered a " + pizza.getName() + "\n");
    }
}
```

```
$ java -jar target/pizzeria-1.0.jar
Preparation of Pizza with Brest style sauce and cheese
Spread the pizza dough...
Add the sauce...
Add the garnitures:
    Parmigiano reggiano
Bake 25 minutes at 180 degrees
Cut the pizza in triangles
Put the pizza in the official box
JMB has ordered a Pizza with Brest style sauce and cheese
```

```
Preparation of Pizza Strasbourg style with cheese
Spread the pizza dough...
Add the sauce...
Add the garnitures:
  Mozzarella
Bake 25 minutes at 180 degrees
Cut in square portions
Put the pizza in the official box
JMI has ordered a Pizza Strasbourg style with cheese
```

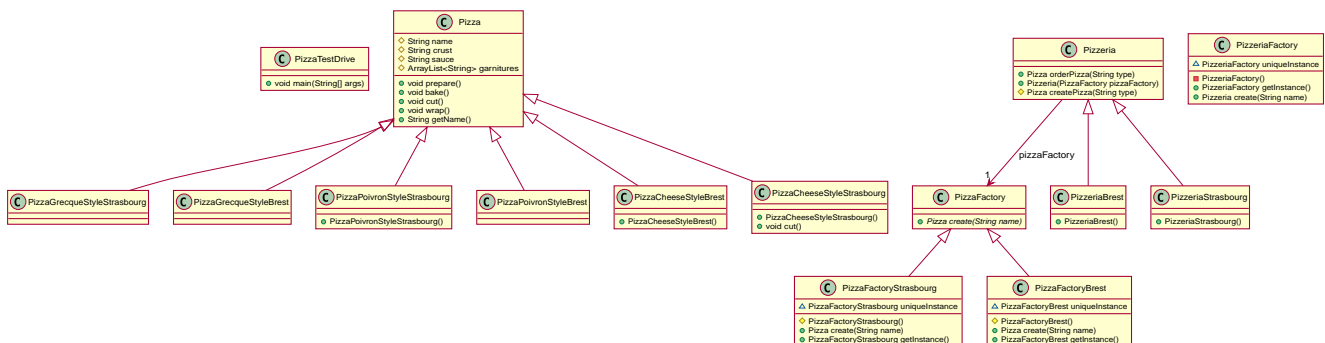

Figure 2. expected Structure

This assessment is graded. The autograding will run the tests via `gradle test` and `maven test`, as well as `test0` and the test of the model. This will constitute 80% of your grade. The remaining 20% will be evaluated by your TA and will focus on the tests (number and quality).

 `commit/push`

```
fix #All: Completed all duties
```
